Here is a modified circuit with a buzzer added in.
Can you write the code so that:
  1) the LED is on if the button is not pressed
  2) when the button is pressed, the LED turns off
and the buzzer makes a noise

HINT *Start with the code we used for the button*

How can we code the buzzer so that it makes a
different sound?

HINT *Think about how we changed the brightness of
an LED*
